Fulton FB-S Horizontal Fuel-Fired Steam Boiler

Capacity Range From 60-400BHP

Fulton
FB-S
Steam Boiler

Three-pass/ Wet-back/ Corrugated furnace

The New Tradition

Design Feature

1. FB-S boiler is designed and manufactured to comply with ASME code and Chinese Boiler Standard, with maximum working pressure of 1.04 MPa (150psi) to 1.28 MPa (185psi).
2. Standard model is three- pass, wet-back, and corrugated furnace design boiler with generous heating surface.
3. Selected brand burner fully matches with the boiler.
4. Fuel flexibility: Light oil, Heavy oil, Natural gas, Town gas and Dual-fuel.
5. 3 year warranty on pressure vessel backed by Fulton worldwide service and spares system.

Operating Principal

The standard model for FB-S is three pass, wet-back and corrugated furnace design boiler. In the first pass, the flame and high temperature flue gas flows from the front to the back of the furnace; Through the second pass pipes, high temperature flue gas flows from the combustion furnace to the front chamber; In the third pass, the flue gas passes through the third pass pipes to the back of the boiler stack and vents out. Corrugated furnace highly increases the heat exchange area, heat transfer efficiency and reduces the possible damage to the boiler durability caused by heat expansion and cold contraction. Generous heating surface maximizes heat transfer with minimum thermal stresses, providing high efficiency and long boiler life.

The standard model for FB-S is three-pass, wet back and corrugated furnace design boiler. In the first pass, the flame and high temperature flue gas flows from the front to the back of the furnace; through the second pass pipes, high temperature flue gas flows from the combustion furnace to the front chamber; In the third pass, the flue gas passes through the third pass pipes to the back of the boiler stack and vents out.

Corrugated furnace highly increases the heat exchange area, heat transfer efficiency and reduces the possible damage to the boiler durability caused by heat expansion and cold contraction.

Large water content and steam chamber ensure low sensitivity to load change, and stability of steam pressure & steam quality.

Combustion chamber located well below water level with generous clearance from bottom of boiler allowing proper circulation. Low located combustion chamber provides additional safety margin between furnace and water level, make less water carryover and supplies better quality steam.

Water level probe directly immerses into pressure vessel, avoids false water level, increases operating safety.

Fulton adopted the design of "air-insulation" to reduce heat exchange loss from the front smoke box.

As a Fulton tradition, burner is chosen to fully match with the boiler. High efficiency, optimum performance is achieved to meet varying load demand and provide high combustion efficiency. Emission is limited to a low level to comply with the environmental requirement.
